Paging

- CR3 , Page Global Directory , Page Upper Directory , Page Middle Directory , Page Table Entry are used
- each register or variable holds an encoded pointer, not a raw pointer
- the 12~51 bits of each register or valiable indicates the base address of the next directory
- see <u>5.3.3 4-Kbyte Page Translation / AMD64 Architecture Programmer's Manual, Volume 2</u> for details
- last byte of Page Global Directory(PML4E) often be 0x67(0b01100111)
