## **Physmem**

- page tables
  - page\_offset\_base
    - heap base address (by kmalloc) and it is mapped to /dev/mem
    - secondary\_startup\_64 can be found at page\_offset\_base + offset
  - vmalloc\_base
  - vmemmap\_base
    - base address of <u>pages</u>

### **Paging**

- CR3 , Page Global Directory , Page Upper Directory , Page Middle Directory , Page Table Entry are used
- each register or variable holds an encoded pointer, not a raw pointer
- the 12~51 bits of each register or valiable indicates the base address of the next directory
- see <u>5.3.3 4-Kbyte Page Translation / AMD64 Architecture Programmer's Manual, Volume 2</u> for details
- last byte of Page Global Directory(PML4E) often be 0x67(0b01100111)
